Model selection

- existing anomaly detection frame work
- autoencoder
- anomaly transformer

AutoEncoder

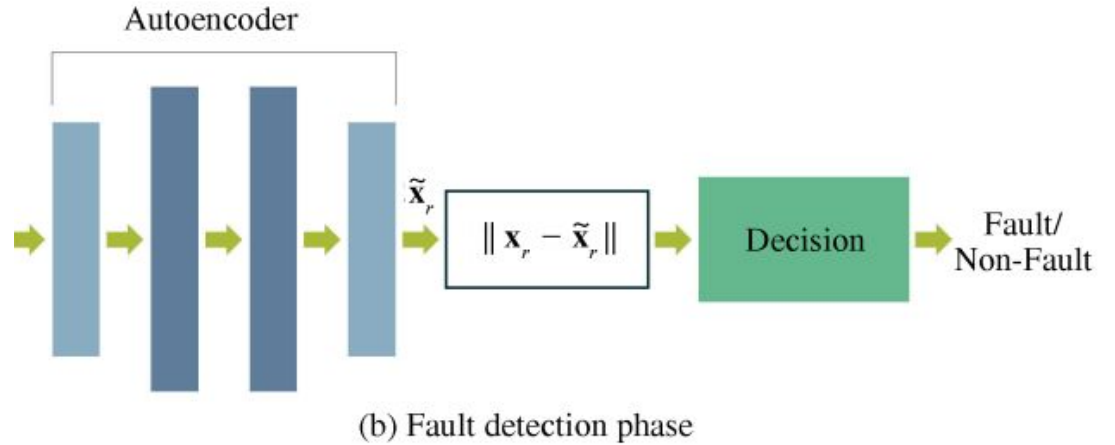

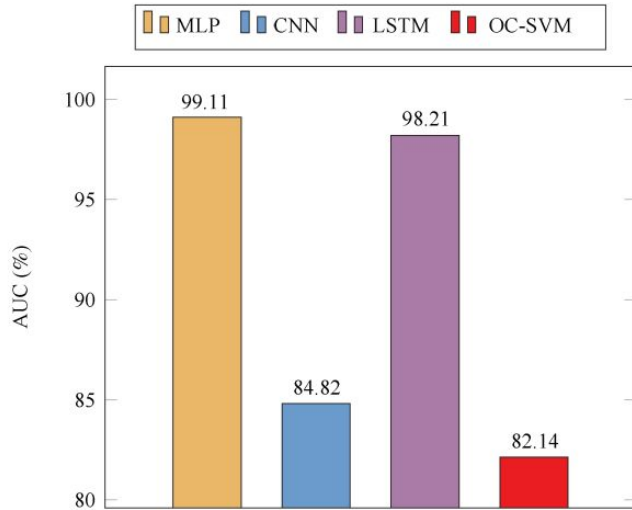

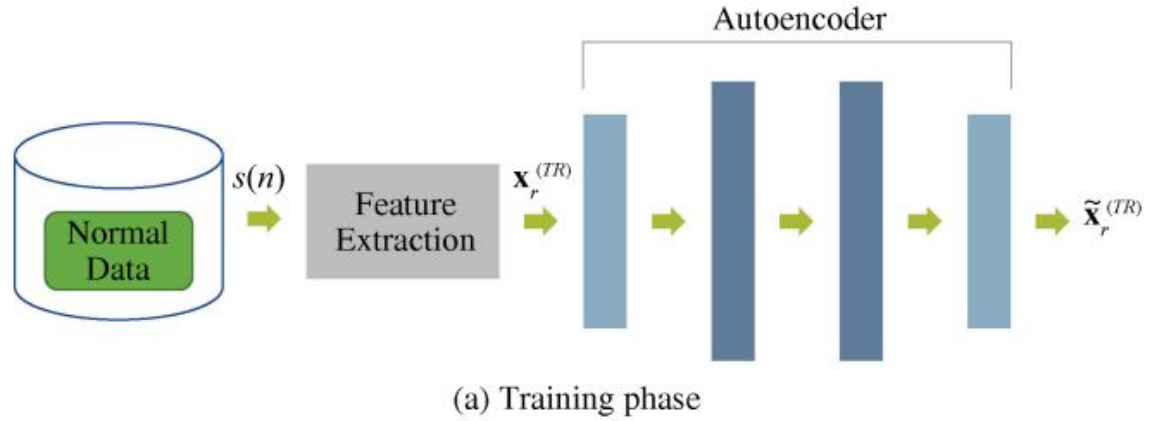

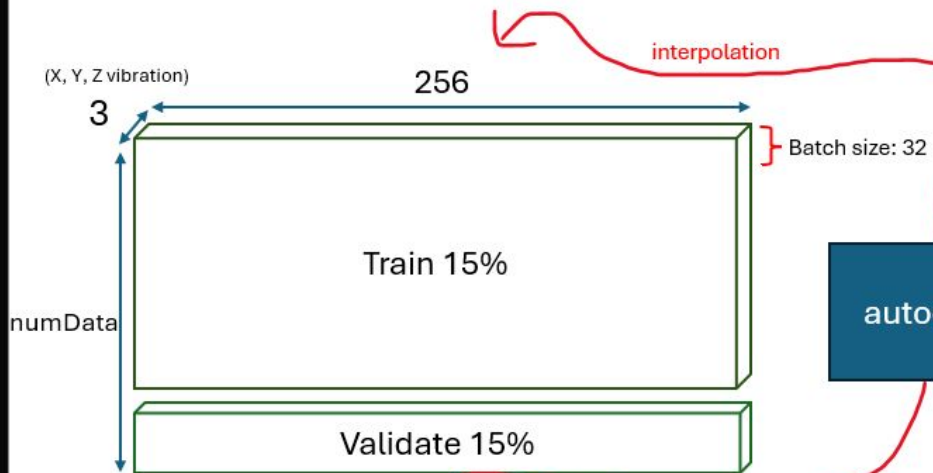

Fig. 7. Results obtained for the different autoencoder topologies and the OC-

Input: x

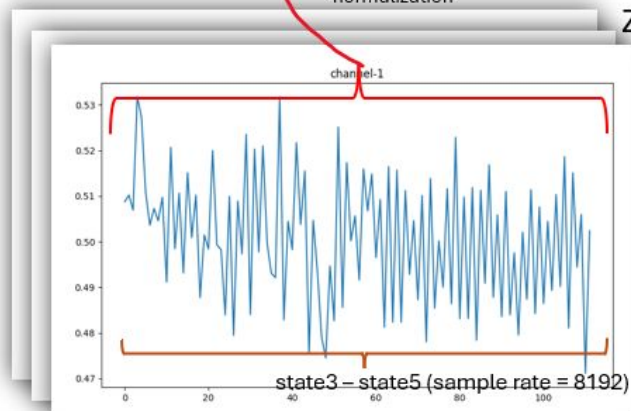

Reconstructed x

normalization

Z-vib
Y-vib
X-vib

numData x

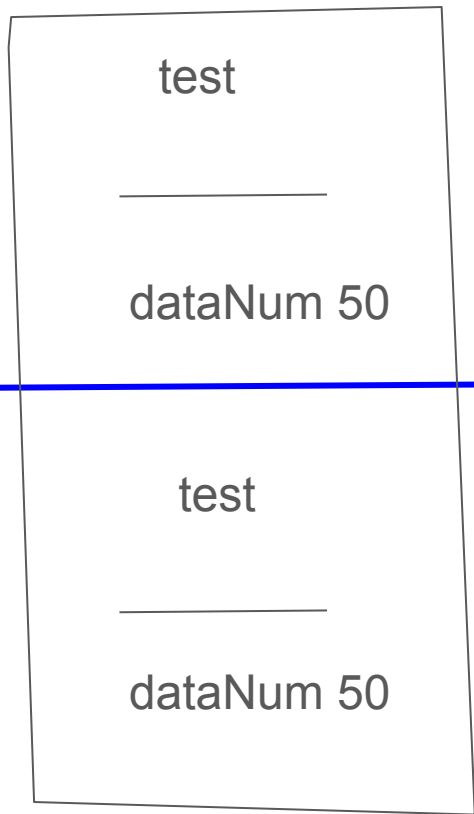

Flatten (3*100) to calculate loss

```
loss = F.mse_loss(  
    reconstructed_x.view(-1, channels * timeStamps),  
    x.view(-1, channels * timeStamps),  
    reduciton = 'sum')
```

P.s. I weren't planned to use sliding window to cut the data, because I think  part is just a complete pattern and the model should just analyze the whole pattern. Or maybe other ideas?

Noramal Data (0604-0605) sampleRate 8192

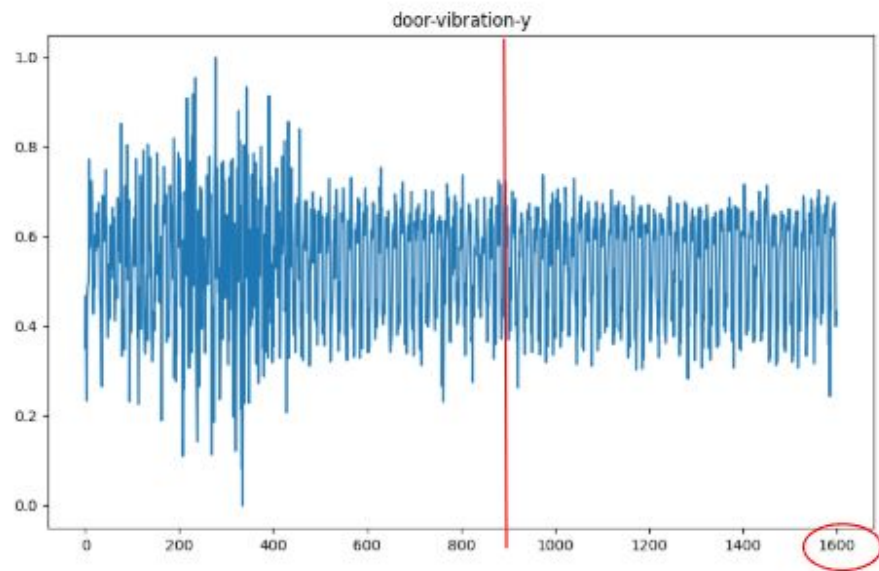

Abnormal Data (0607) sampleRate 8192

combine the two plots above

abnormal data

sample rate = 128

normal data

channel 234

channel 567
